# Melamine

---

## Technical information

---

### Care and Maintenance

For general care and maintenance, simply wipe away most spills or marks with a damp cloth, or use an all purpose cleaner such as Windex spray cleaner or Ajax Spray n Wipe. Rubbing gently with a clean, dry cloth brings back the brightness of laminates and melamines. With a few sensible precautions, your Laminex® or Polytec melamine surface will enjoy a long lifespan.

DO NOT use any of the following on your Laminex or Polytec melamine surface:  
Commercial Cleaning Products, Abrasive Cleaners, Scouring Pads or Abrasive Papers, Acids and Alkalis, Solvents, Thinners, Turpentine (Turps), Ammonia, Bleach, Acetone, Easy-Off BAM!, M.E.K. or any other cleaning agents containing organic solvents or the above mentioned products.

Always refer to the manufacturer's website for specific and more detailed care information.

---

### Environmental

P4 chooses to use E0 particleboard or LDF as a standard substrate for all melamine finishes. Other substrates available on request.

---

### Colour Palette

P4 reserves the right to alter its current colour palette, including choice of manufacturer, at any time and without notice. If you prefer a different colour, shade or finish, please discuss with us. If it is suitable for the product and/or application we will be happy to offer it.

---

### Finishes

P4 has selected the most appropriate finish for each colour based on popularity and value for money. Currently, this includes Natural, Flint and Matt (as indicated) and may change at any time and without notice. If a specific finish is required for your project please refer to the manufacturer specification and advise P4 at time of requesting quotation.

---

### Product Availability

Standard melamine finishes in this Colour Chart are available at no additional cost on most locally produced P4 melamine products. Some finishes, including those marked as Premium, will incur additional charges.

---

### Melamine or Laminate? Choosing the Right Product

Melamine finishes are typically referred to as a laminate, but they are very different. LPM, or Low Pressure Melamine, is produced and supplied as pre-finished decorative board on a substrate (usually particleboard or MDF) in various thicknesses. Commonly used in furniture production and most standard cabinetry applications, Melamine offers a high quality, value-for-money finish.

HPM, or High Pressure Laminate, is manufactured in sheets and needs to be applied to a substrate during the furniture production process. The decorative, coloured surface is thicker and more durable than Melamine and is designed for high use, medium impact areas such as kitchen bench tops and wall panelling, or where the desired finish is not available in Melamine. Laminate is always a more expensive option.

There's also chemical-resistant HPL, for use in laboratories, and fire-rated HPL, for compliance with specific fire safety standards.

If unsure what's best for your project, just ask.
